This book was first published in 1975, I believe. I purchased it in the 1980s. At the time, it was the only authoritative book on the subject of building your own effects. Finding schematics and parts was, to say the least, difficult. Rackmount processors were just beginning to dominate the marketplace. Craig Anderton emphasized low noise in designing the circuits and the projects represented the state of the art, but they might be somewhat noisy by today's standards (they are still fairly quiet, though). In this modern age, schematics, parts, and tips on building your own projects are just a mouse click away. For the amount of money it would cost to build the projects in this book, one could buy a multieffects box that is, arguably, more versatile with better fidelity. However, EPFM is far from obsolete, especially in an era where analog effects are (thankfully) becoming all the rage again. The book might benefit from a revision that addresses the increased resources available via the internet and, if feasible, circuit design modifications which reflect any technological advancement in noise reduction. Nonetheless, EPFM is still the standard for entering into the field of audio electronics. That is no accident. Some reviewers lament the book is not very in-depth and does little more than teach you to solder. Craig Anderton makes no secret of

the fact that his objective is to whet your appetite and give you the opportunity to create some usable effects as effortlessly as possible. He succeeds. The accompanying CD reveals that these are all wonderful sounding effects. The ring modulator is my personal favorite and the phaser sounds as good as any on the market.
